Research note

First record of *Longidorus intermedius* Kozlowska and Seinhorst, 1979 (Nematoda: Longidoridae) from the Czech Republic

Summary

Longidorus intermedius Kozlowska and Seinhorst, 1979 was recorded in the Czech Republic for the first time in the rhizosphere of *Robinia pseudoacacia* at Dolní Bojanovice and *Carpinus betulus* - *Euonymus europaeus* - *Quercus* sp. at Strážovice. The morphological and morphometrical characteristics are studied.

Key words: *Longidorus intermedius*; Nematoda; Czech Republic

Longidorus intermedius Kozlowska and Seinhorst, 1979 has been recorded from several European countries e.g., The Netherlands and Germany (Kozlowska & Seinhorst, 1979), Italy (Roca *et al.*, 1985), Spain (Andrés & Arias, 1987), Belgium (Waele & Coomans, 1990), Bulgaria, Macedonia and Turkey (Peneva *et al.*, 2001), Slovakia (Lišková & Brown, 2003), Austria (Tiefenbrunner & Tiefenbrunner, 2004) and former Yugoslavia (Barsi & Lamberti, 2004).

In this research note we present morphological and morphometrical data of *L. intermedius* from the Czech Republic based on females and all juvenile stages.

During our routine survey of longidorid nematodes from the rhizosphere of grapevine and fruit trees, soil samples were also collected from the rhizosphere of *Carpinus betulus* L., *Euonymus europaeus* L., *Quercus* sp. and *Robinia pseudoacacia* L. at three localities (Černé Voděrady, Dolní Bojanovice, Strážovice). Samples were taken from a depth of 0 – 40 cm. Nematodes were extracted from soil by the sieving and decanting method, heat killed and fixed in TAF, and processed and mounted in anhydrous glycerin. Nematode identification was made using an Olympus BX-51 light microscope, equipped with a digital camera C4040 and differential interference contrast (DIC, Nomarski), which was used further to illustrate and photograph pictures; measurements were made with the aid of imaging soft-

ware (Olympus DP-soft).

***Longidorus intermedius* Kozlowska and Seinhorst, 1979**
L. intermedius was found at Dolní Bojanovice (48° 51' 27" N 17° 1' 47"E) associated with *Robinia pseudoacacia* and Strážovice (49° 00' 48" N 17° 03' 58"E) associated with *Carpinus betulus* - *Euonymus europaeus* - *Quercus* sp. At Dolní Bojanovice, 9 females and 17 juveniles were found in 500 g soil whereas at Strážovice 25 females and 125 juveniles were found.

Morphometrics of females and juveniles are given in Table 1 and photomicrographs are presented in Fig. 1. All juvenile development stages (JDS) were found. They resemble adults except in size. Tail length of juveniles does not change significantly. As compared to adult females the mean value of tail length of juveniles is slightly higher. Tail of JI has a more digitate terminus in some specimens and less digitate in others (Fig. 1G, H). Body diameter at lip region, at guiding ring, at base of pharynx, at mid body and at beginning of hyaline tip increased gradually from JI to JIII. Mean odontophore length of JII is shorter than JI. Morphometrics of all JDS correspond well with juvenile stages described from Bulgaria by Peneva *et al.* (2001) and show a very similar development pattern. Based on the description by Peneva *et al.* (2001) and the data presented here, it is obvious that *L. intermedius* has only three development stages. They were identified by lengths of body, odontostyle and replacement odontostyle (Fig. 2).

The morphology and morphometric data of females of Czech populations of *L. intermedius* are similar to those described in the original description of the species (Kozlowska & Seinhorst, 1979) and by Peneva *et al.*, (2001). Compared to the type material and Bulgarian populations (Peneva *et al.*, 2001), adult females from the Czech have a shorter odontostyle. Other morphometric characters closely

agree with the original description (Kozlowska & Seinhorst, 1979) and comprehensive description of the species by Peneva *et al.*, (2001).

We assume that a comprehensive survey in the Czech forest may show a more wide occurrence of the species in the Czech Republic.

Table 1. Morphometrics of *Longidorus intermedius* Kozlowska and Seinhorst, 1979. Measurements in µm (in form): mean ± standard deviation (range)
